

Item is sitting inside the garage and can be moved outside with a heavy-duty pallet jack. The buyer will need either a boom truck or a 5,000-pound forklift to load it. It has been serviced twice a year since purchased. Output air has been tested quarterly and always met NFPA standards. All the aluminum pressure vessels were replaced a few years ago per manufacture recommendations. The containment section is set up to fill three breathing air bottles simultaneously to 4500 PSI directly from the compressor or from the self-contained 4 bottle cascade system. It also has a connection valve to fill high pressure storage systems on trucks or trailers.
